INTRODUCTION

This is an Overview of the 2003 Report on Survey of the U.S. Shipbuilding and Repair Industry.

The Report is the result of the Maritime Administration’s (MARAD) 2003 survey of the U.S. marine construction and repair industry.

The shipyard classifications and definitions are based on the joint U.S. Navy and MARAD 1982 Shipyard Mobilization Base Analysis (SYMBA). SYMBA established 1982 as the base year for subsequent annual studies and determined that only facilities with build or repair positions 375 feet (114 meters) or greater would be included in the Major Shipbuilding and Repair Base. This shipyard capability parameter was increased to 400 feet (122 meters) in 1985. The term “Major Shipbuilding and Repair Base” used in this Overview is synonymous with the Shipyard Mobilization Base referred to in the SYMBA. There are, of course, many more shipyards active in shipbuilding than those described in this Overview, please note that only those shipyard facilities which meet the above definition have been included.

During 2003, the Major Shipbuilding and Repair Base saw a decrease of four shipyards, a decrease of two shipbuilding or repair positions and an increase of approximately 400 production workers.

If you have any questions or want to receive a copy of the 2003 Report on Survey of the U.S. Shipbuilding and Repair Industry, please contact the Office of Shipbuilding and Marine Technology, Attention Daniel Seidman at (202) 366-1888 or by e-mail at Daniel.Seidman@MARAD.DOT.GOV.

Additional information on the Shipbuilding Industry can be found on the National Maritime Resource and Education Center (NMREC) website at http://www.marad.dot.gov/NMREC

SHIPYARD CLASSIFICATION DEFINITIONS

Active Shipbuilding Yards
The Active Shipbuilding Yards is comprised of those privately owned U.S. shipyards/facilities, that are open with at least one building position capable of accommodating a vessel 122 meters (400 feet) and over in length, and are currently engaged in the construction of naval ships and/or major oceangoing merchant vessels 122 meters (400 feet) and over in length.

Shipyards With Build Positions
Shipyards With Building Positions are those privately owned shipyards/facilities that are open with at least one building position capable of accommodating a vessel 122 meters and over in length, and that have not constructed a naval ship or major oceangoing merchant vessel in the past two years. The shipyards may not be capable of ship construction without significant capital investments. These shipyards could, however, be used in module ship construction.

Repair With Drydocking
Repair (with drydocking) facilities are those shipyards that have graving docks, floating drydocks or marine rails capable of handling naval ships and/or major oceangoing merchant vessels 122 meters and over in length. These shipyards may also be capable of constructing vessels less than 122 meters in length.

Topside Repair
Topside repair facilities are those shipyards that have sufficient berth/pier space, including dolphins, to accommodate a naval ship or major oceangoing merchant vessel ships of 122 meters and over in length. These shipyards may also be capable of constructing and/or drydocking vessels less than 122 meters in length.

GENERAL REQUIREMENTS
The shipyard must own or have in place a long-term lease (1 year or more) on the facility in which they intend to accomplish the work. There must be no dimensional obstructions in the waterway leading to open ocean (i.e., locks, bridges). Water depth in the channel to the facility must be a minimum of 3.7 meters (at Mean Low Tide {MLT}).

NOTE
The following criteria were developed to establish the maximum ship size that could be accommodated in each drydock:

For floating drydocks, the maximum ship length is as given by the shipyards. The maximum beam is determined by allowing a 0.6 meter clearance at each side between the ship and wing wall.

For graving docks, the maximum ship length is determined by allowing a 0.6 meter clearance at each end between the ship and the inside of the dock at the floor. The maximum beam was determined by allowing a 0.6 meter clearance on each side between the ship and each side of the dock entrance at the sill, unless the shipyard indicated more clearance is required.

There are several types of floating drydocks and graving docks, and under certain circumstances additional clearance would be necessary between the ship and the dock body. Permissible ship sizes requiring additional clearance may be determined by simple calculation from the above criteria.
